

菜鸟快，但不是处处都快 | Cainiao is Fast —But Not Everywhere

中文

一句话概览

本项目是 BUAD 345（决策分析与可视化）期末课程项目，用 **R** 做分析、**Tableau** 做可视化，研究阿里巴巴菜鸟物流网络是否真的让订单履约更快。受众设定为**菜鸟平台**，遵循“数据驱动 + 层级深挖 + 故事讲述”的课程要求。

主结论不是“菜鸟全面更快”，而是：菜鸟整体比非菜鸟快约 **9.2 小时**，但在「**大城市目的地 + 小物流公司**」这一格反而慢 **3.3 小时**，该格客户评分也最低，瓶颈出在**设施间干线运输 (line-haul)**，而非最后一公里。

两句话总结

1. 菜鸟整体显著缩短订单履约时间（约 9 小时，且通过承诺时效对照检验稳健）。
2. 但这一优势在「大城市 + 小承运商」组合下基本消失甚至反转，根因在干线运输而非最后一公里。

关键结果

评价区间 2017-01-01 至 2017-07-31，单位小时，定义 $\text{totaltime} = \text{SIGNED} - \text{pay_timestamp}$ 。

目的地城市	物流公司	菜鸟 (h)	非菜鸟 (h)	菜鸟省下 (h)	样本量
大城市	大公司	44.7	54.2	+9.5	96,301
大城市	小公司	52.4	49.1	-3.3	22,756
小城市	大公司	61.7	72.2	+10.5	857,583
小城市	小公司	67.1	75.2	+8.0	311,798

punchline (转折点) 净值对比

机制：时间分段（干线运输主导，非最后一公里）

方法

层级式深挖（每层在上一层结论基础上加一个变量），而非彼此无关的并列对比：

层级	加入的变量	结论
L1	菜鸟 vs 非菜鸟	菜鸟快约 9.2h; 剔除承诺时效后仍成立
L2	+ 物流公司规模 (>20 万单为大)	大公司省 10h, 小公司省 7h
L3	+ 目的地城市规模 (前 2 大签收城市为大城市)	大城市 × 小公司: 菜鸟反而慢 3.3h
机制	揽收 / 干线 / 最后一公里分段	差距在干线运输, 不在最后一公里

诚实的反例: 小承运商经过的城市反而**更少** (不支持“多次中转”假设), 故瓶颈是单段转运/停留时间。

仓库结构

```

├── R/                                # 分析流水线 (在仓库根目录运行)
│   ├── 01_build_analysis_table.R    # 三个 CSV → 订单级分析表 (时间/分段/规模)
│   ├── 02_aggregate_and_export.R    # → tableau_data/*.csv + 打印关键数字
│   ├── 03_figures.R                 # → figures/*.png
│   └── run_all.R                     # 顺序运行 01→02→03
├── tableau_data/                     # 体积小、可入库的聚合 CSV (Tableau 数据源)
├── tableau/                          # TABLEAU_BUILD_GUIDE.md: 逐看板搭建指南
├── figures/                          # R 生成的图
├── report/                           # report.tex/md/pdf (~9 页) + slides.tex/pdf (Beamer) + 演示提纲
└── Cainiao_Project.r                # 原始起步脚本 (保留)

```

快速开始

需要 R (data.table、lubridate、ggplot2) 以及根目录下的三个原始 CSV (未随仓库分发, 见数据说明)。

运行完整分析流水线

```
Rscript R/run_all.R
```

编译报告与答辩稿 (需 LaTeX)

```
cd report && pdflatex report.tex && pdflatex report.tex
pdflatex slides.tex && pdflatex slides.tex
```

Tableau 看板按 tableau/TABLEAU_BUILD_GUIDE.md 基于 tableau_data/ 搭建。

交付物

交付物	文件
书面报告 (~9 页, 含真实文献引用)	report/report.pdf
答辩稿 (LaTeX Beamer, 14 帧)	report/slides.pdf
演示提纲	report/presentation_outline.md
Tableau 搭建指南	tableau/TABLEAU_BUILD_GUIDE.md
可视化数据源	tableau_data/*.csv

数据说明

原始三个 CSV 为非公开 M&SOM 数据集 (“Do NOT share the data”), 且物流文件达 969MB (超过 GitHub 100MB 上限), 因此**已通过 .gitignore 排除、未推送**。仓库只包含派生的**聚合统计表**与去标识抽样, 不含原始数据。

English

At A Glance

BUAD 345 (Decision Analytics and Visualization) final project. Analysis in **R**, visualization in **Tableau**. We study whether Alibaba's **Cainiao** logistics platform actually makes order fulfillment faster. Audience: **Cainiao**. The work follows the course's data-driven, hierarchical, story-first rubric.

The main result is not "Cainiao is faster everywhere." Cainiao is about **9.2 hours faster** overall, **but** for **big-city destinations handled by small carriers it is 3.3 hours slower**, customer reviews there are the lowest in the network, and the bottleneck is **between-facility line-haul**, not the last mile.

Two-Sentence Summary

1. Cainiao significantly shortens fulfillment time across the marketplace (~9 h, robust to a promise-window control).
2. But that advantage largely disappears —and reverses —for big-city destinations served by small carriers, with the bottleneck in line-haul rather than the last mile.

Data note	Data Note

Key Results

Period 2017-01-01–2017-07-31; hours; totaltime = SIGNED – pay_timestamp.

Destination	Carrier	Cainiao (h)	Non-Cainiao (h)	Cainiao saved (h)	n
Big city	Large	44.7	54.2	+9.5	96,301
Big city	Small	52.4	49.1	–3.3	22,756
Small city	Large	61.7	72.2	+10.5	857,583
Small city	Small	67.1	75.2	+8.0	311,798

Method

Hierarchical, not parallel —add one variable per level:

Level	Added variable	Result
L1	Cainiao vs non-Cainiao	~9.2 h faster; holds after a no-promise control
L2	+ carrier size (Large = >200k orders)	Large saves 10 h, Small saves 7 h

Level	Added variable	Result
L3	+ destination-city size (top-2 signing cities)	Big city × Small carrier: Cainiao 3.3 h slower
Mechanism	pre-delivery / line-haul / last-mile	Gap is line-haul, not last mile

Honest non-result: small carriers pass through *fewer* cities (no “more stops”), so the penalty is per-leg transit/dwell, not hop count.

Repository Structure

```

.
├── R/                  # analysis pipeline (run from repo root)
├── tableau_data/       # small, committed aggregate CSVs (Tableau sources)
├── tableau/           # TABLEAU_BUILD_GUIDE.md (step-by-step build guide)
├── figures/           # ggplot figures
├── report/            # report.tex/md/pdf (~9 pp) + slides.tex/pdf (Beamer) + outline
└── Cainiao_Project.r   # original starter script (kept)

```

Quick Start

Requires R (data.table, lubridate, ggplot2) and the three raw CSVs in the repo root (not distributed —see Data Note).

Rscript R/run_all.R

```

cd report && pdflatex report.tex && pdflatex report.tex
pdflatex slides.tex && pdflatex slides.tex

```

Build the Tableau story from tableau_data/ using tableau/TABLEAU_BUILD_GUIDE.md.

Deliverables

Deliverable	File
Written report (~9 pp, real citations)	report/report.pdf
Defense slides (LaTeX Beamer, 14 frames)	report/slides.pdf
Presentation outline	report/presentation_outline.md
Tableau build guide	tableau/TABLEAU_BUILD_GUIDE.md
Visualization data sources	tableau_data/*.csv

Data Note

The three raw CSVs are a non-public M&SOM dataset (“Do NOT share the data”) and the logistics file is 969 MB (over GitHub’ s 100 MB limit), so they are **git-ignored and not pushed**. Only derived **aggregate** tables and a de-identified sample are committed.
