

Presentation Outline — Cainiao Fulfillment Story (BUAD 345, Group 12)

~11 slides. One takeaway per slide; each maps to a Tableau sheet from `tableau/TABLEAU_BUILD_GUIDE.md`. Audience: **Cainiao**. A ready-to-present LaTeX Beamer version of this is in `report/slides.pdf`.

#	Slide	One-line takeaway	Visual
1	Title	“Is Cainiao actually faster — and where isn’t it?”	—
2	Motivation	Delivery speed drives satisfaction; Cainiao runs 30.2% of orders.	Sheet 1 (KPIs)
3	Main idea	Test whether Cainiao makes overall fulfillment faster.	text
4	Headline finding	Cainiao orders arrive ~9.2 h faster on average (61.9 vs 71.0 h).	Sheet 2
5	Fair comparison	Holds after dropping promised-speed orders (62.5 vs 71.0 h).	Sheet 2 / control
6	Dig 1: carrier size	Gap is smaller on small carriers (7 h) than large (10 h).	Sheet 3 (Cainiao × LCsize)
7	Dig 2: + city size (PUNCHLINE)	For big-city destinations on small carriers , Cainiao is 3.3 h slower .	Sheet 3 (2×2 grid, focus cell)
8	Mechanism	The extra time is line-haul , not last-mile.	Sheet 4 (segments)
9	Why (honest)	Small carriers pass through fewer cities — so it’s per-leg transit, not more stops.	Sheet 5
10	So what	Three moves for Cainiao.	text
11	Two-sentence summary	S1 + S2 (below).	text

Three practical moves (slide 10)

1. **Strengthen relationships with large carriers** for reliable performance — while watching the concentration risk this creates.
2. **Make smart-routing carrier-capability-aware** (size, coverage, experience) so small carriers aren’t handed routes they can’t execute efficiently.

3. **Pilot pickup lockers / local consolidation in big cities** for small-carrier shipments to cut the pickup and line-haul penalty.

Two-sentence summary (slide 11)

- **S1 (overall):** Cainiao significantly shortens order fulfillment time across the market-place.
- **S2 (punchline):** But that advantage largely disappears for big-city destinations served by small carriers, and the bottleneck sits in pickup and line-haul rather than the last mile.

Limitations to acknowledge verbally

Observational data — assignment to Cainiao is not random (selection/causality); “cities passed” and segment times have missing milestones in a real-world feed; big-city flag is a coarse two-city proxy.
